Product Introduction

Molecular biology is a discipline that understands biological phenomena at the molecular level. By Studying the morphological and structural characteristics of all biological macromolecules such as DNA and RNA, as well as their significance, regularity, and interrelationships, it clarifies the essence of various life phenomena. Molecular biology leads us to understand the structure of genes, the regulation of gene expression, genetic engineering technology, the molecular mechanisms of disease occurrence, and the strategies of genetic diagnosis and gene therapy. At present, molecular biology has permeated into every field of life sciences. Solarbio offers a wide range of molecular biology-related products with extensive applications, including plasmid and nucleic acid extraction, nucleic acid electrophoresis, vector construction and genetic transformation, as well as enzymes, kits, dyes, buffers, precast gels, auxiliary reagents and consumables related to nucleic acid detection such as PCR and RT-qPCR. The product quality is stable and reliable, with a variety of specifications, which can meet the needs of different types of experiments.

Fluorescence Quantitative PCR (qPCR) Testing Service

——Internal Reference Included

I. Service Overview

Real-time fluorescence quantitative PCR (Real Time PCR) technology refers to a method that immediately determines the amount of specific products by continuously monitoring the changes in the intensity of fluorescence signals during PCR exponential amplification, and finally quantitatively analyzes the unknown template through a standard curve. The fluorescence detection methods of fluorescence quantitative PCR include two methods: SYBR green (fluorescent dye incorporation method) and Taqman probe (probe method).

II. Service Contents

1.Extract nucleic acids from samples such as animal cells, human or animal tissues;

2.The concentration and purity analysis of nucleic acid;

3.The fluorescence quantitative PCR detection;

4.Preliminary experimental service: provide customers primers and probes according to the target gene sequence or NCBI sequence number provided by the customers, and screen the optimized primers and probes;

5.Formal experimental service: according to the primers and probes selected in preliminary experiments, detect all the samples by fluorescent quantitative PCR and statistically analyse the result.

Project Services	Content	Period (Working days)
DNA or RNA extraction	Cell sample	5
	Tissue sample	5
Primer design and synthesis	Primer optimization & probe design and synthesis	7
	Optimize primer design and synthesis	5
	Primer synthesis	3
RT reaction	mRNA reverse transription into cDNA	5
Standard curve making	Relative quantification (double standard curve method)	5
	Absolute quantification	
Fluorescent quantitative PCR detection	Gene	10

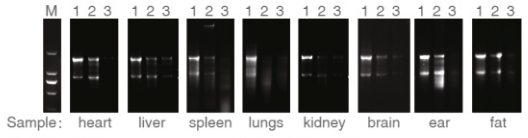

Featured Products

RNA Extract Kit for Tissue

It improves the classic guanidine cyanate RNA extraction method.The improved lysis buffer rapidly lyses tissue, releasing RNA while simultaneously inactivating RNases. RNA selectively adsorbs to the silica membrane within the spin column under a highly dissociated salt state. A series of washes and centrifugation steps further remove impurities such as proteins, and RNA is finally eluted from the silica membrane using RNase-free ddH_2O.

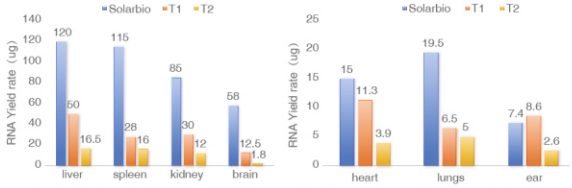

RNA Extract Kit for Tissue is highly efficient, rapid, and convenient. Following tissue lysis, extraction can be completed in just 20 minutes. This kit can purify up to several hundred micrograms of high-purity RNA from 25 to 80 mg of animal tissue, free of protein and genomic DNA contamination. The extracted RNA can be directly used in various molecular biology experiments, such as RT-PCR, qPCR, and cDNA library construction.

miRNA Extract Kit for Cell and Tissue

It is next-generation product, developed specifically for miRNA extraction, boasts non-toxic and harmless properties. Furthermore, the small RNA (small RNA) extracted using this kit comprises over 95% of RNA in the 15-200 nt range, with virtually no large RNA or DNA. The lysis buffer in this kit has been refined through extensive research and development, resulting in enhanced lysis and extraction sensitivity. The adsorption column utilizes a special silica-based membrane, significantly enhancing its adsorption capacity for RNA, particularly small RNA (<200 nt). The resulting RNA is of higher purity and quality. Extraction is simple and rapid, with the entire process completing in approximately 30 minutes. The resulting RNA is of high purity and yield, allowing for direct use in a variety of downstream experiments.

Solarbio	R2220	miRNA Extract Kit for Cell and Tissue	25T/100T

Direct PCR Kit for Tissue

This lysis buffer can fully lyse the tissues, and its components do not affect PCR amplification, so that the lysis products can be directly used as templates for PCR reactions. Some samples are easier to lyse, such as the spleen and kidney. These tissues have fewer PCR inhibitors, and the nucleic acids are completely released after lysis. For some tissues that are difficult to lyse, such as the heart, liver, lungs, and tail, this lysis buffer can also achieve a good lysis effect. There are a large number of substances in animal tissues that inhibit PCR reactions. The DNA polymerase in this kit has strong amplification performance and can achieve good amplification effects even for crude samples containing a small amount of PCR inhibitors.
